

Optimimisation & USP

Multi system:

1. Water sub-metering

- Measures warm and cold water

Improvement:

- Using the measurement of cold and warm consumption water to evaluate its use in comparison and make advice to the tendent to reduce warm water usage

2. MSD (Multi Sensor Devise)

- Measures temperature in the room and the amount of moisture.

Improvement:

- Monitoring and alerting if room temperature and moisture is increasing to prevent rising of mold inside of the room or apartment.
- Gives advice to open the windows in the room or apartment to air it up and also warns the tenant of potential loss of heat in the room or apartment in case of air up if the windows are open.
- Gives also the advice to tun off the heat.

3. Heat sub-metering

- Measures the room temperature according to a heat in using.

Improvement:

- Gives advice to turn on/off the heat if room temperature is too low or high.
- Monitoring and shows energy consumption per kilowatt hour and can implement a “green stamp” regarding to green energy consumption and CO2 emissions.

4. EV-Charging

- Measures the energy consumption according to its usage for electric cars and E-bikes etc.

Improvement:

- Using measurement to regulate energy consumption and usage behaviour of tenants.
- Establishing a time schedule for usage intervals during a day (i.e. twice per day from 08:00-15:00 and from 21:00 to 24:00) where tenants can use the station.
- Displaying the frequency and intensity of needed energy per usage.
- Establishing of an alert function for the tenants via an account in the application to inform user that loading process is completed.
